THE DAILY PDP CHECK

Your PPC dashboard is the last place a listing problem shows up.

By the time ACoS moves, the cause is already days old.

The 6 changes I check on every SKU, every morning, and the decision each one triggers.

HOW MOST TEAMS FIND OUT

PPC doesn't create the problem. It reports it, late.

FIRST	THEN	THEN	FINALLY
Something changes on the page	→ Fewer clicks convert	→ ACoS climbs	→ Someone asks why

Every day in that chain is ad spend sent to a page that changed. I'd rather catch it at step one.

WHY IT MATTERS MORE THIS Q4

More sellers can now compete on your listing.

1

Amazon dropped the eligibility screen for the Featured Offer

Announced July 2026, rolling out through the end of the year. Every offer is now ranked.

2

Detail pages can change without you editing them

Titles, images and variations get updated from other contributions.

3

Q4 clicks are the most expensive of the year

The worst time to send traffic to a page you haven't looked at.

Source: Amazon Featured Offer update, July 2026

WHAT I CHECK, EVERY SKU, EVERY DAY

6 signals. Before I open the ad console.

1 Featured Offer

Lose it and your ads stop delivering. The sale goes to another seller.

2 Price

One change can cost you deal eligibility before an event.

3 Title & bullets

The words that ranked you can quietly disappear.

4 Main image

The click is won or lost at thumbnail size.

5 Delivery promise

A later date drops conversion without any error message.

6 Variations

A suppressed child splits traffic and reviews.

AN ALERT IS NOT A DECISION

Each signal has one action, the same day.

IF THIS CHANGES	I DO THIS
1 · Featured Offer lost	Check who won it and at what price. Unauthorised seller: test buy, then Brand Registry.
2 · Price moved	Check it against MAP and the deal price floor before the next event.
3 · Title or bullets changed	Compare with the approved copy. Restore it and open a case if Amazon overwrote it.

Swipe for 4-6 →

AN ALERT IS NOT A DECISION

Every alert gets an owner, not a meeting.

IF THIS CHANGES	I DO THIS
4 · Main image swapped	Restore the approved image, then watch CTR on that ASIN.
5 · Delivery slower	Check stock and inbound. Slow ad spend on that ASIN until it recovers.
6 · Variation suppressed	Fix the parentage, then check the rating on each child.

WHY I AUTOMATED IT

Nobody opens every listing, every day. A system can.

- **Every SKU checked each morning**
  Whether it's 10 SKUs or 1,000+
- **Only changes become alerts**
  No dashboard to read. Silence means nothing moved.
- **Each alert lands with an owner**
  Fixed the same day, before the ads pay for it

The check is automated. The decisions aren't.

BEFORE YOU SCALE Q4 SPEND

Check the page before you pay for the click.

TELL ME

Which of these 6 has cost you the most this year?
